CSE-561
Modeling & Simulation Theory and Application
Spring 2012
19471

General: Building/Classroom: BYAC-240
Lecture Days & Hours: Tu., Th., 1:30 – 2:45 pm
Course Portal: http://my.asu.edu

Instructor
Hessam S. Sarjoughian
Dept. of Computer Science & Engineering, School of Computing and Informatics
Bldg/Room: BY/476
URL: http://sarjoughianfaculty.asu.edu/
Office hours: Tu, 2:45 – 3:45; W, 1:15 – 2:15 pm; and by appointment.

Textbooks
- Introduction to DEVS Modeling & Simulation with JAVA: Developing Component-based Simulation Models, B.P. Zeigler and H.S. Sarjoughian (available from Blackboard)

References
- Simulation Model Design and Execution: Building Digital Worlds, P. Fishwick, 1995
- Parallel and Distributed Simulation Systems, R.M. Fujimoto, 2000
- Model-Based Systems Engineering: an introduction to the mathematical theory of discrete systems and to the tricotyledon theory of system design, W. Wymore, 1993

Software

Prerequisite:
To enroll in this course, graduate standing in Science or Engineering degree programs (e.g., Computer Science, Electrical Engineering, Industrial Engineering, Mechanical Engineering, or Physics) is required. Maturity in Java or another high-level computer programming language is assumed. Prior object-orientation modeling experience is helpful, although not assumed.

Course Objectives:
Present concepts of computer-based modeling and simulation applicable to various domains of engineering and science. Provide theoretical concepts, methods, and hands-on experience with object-oriented modeling and simulation. Students are expected to gain a solid foundation and associated experience for computer-based tool set for constructing, simulating and analyzing models of complex systems.

Course Description:
The course covers modeling and simulation concepts and discrete-event in particular. Application of theories, methods, and practices are covered during the semester. The course materials are divided into three parts. The first part provides background review and discussion on systems modeling concepts and overview of object-oriented programming languages. The second part provides background review and discussion on systems modeling concepts and overview of object-oriented programming languages. This part contains comprehensive descriptions on how to formulate and execute (simulate) models in a software engineering-like lifecycle. Students are engaged in detailed study of modeling elements, simulation protocols, and their relationships including experimentation. In-class description of modeling and simulation techniques will be illustrated by examples developed in the DEVSSuite and CoSMoS (Component-based System Modeling and Simulation) tools. During the semester students will gain hands-on experience (via homework assignments and project). Students will create increasingly more complex models, which can be subsequently simulated and analyzed. The third part focuses on selected advanced topics aiding individual and team members’ projects. An important part of the course experience is through the class project. Each project involves demonstrating the application of course
concepts, theory, and techniques (see Project section below) to area of interest to the student. Projects may focus on M&S methodologies and theories.

**Homework Assignments/Exams:**
There will be 3-5 homework assignments. Homework assignments include conceptualizations, model formulations, simulations, etc. Late homework will be accepted only in exceptional circumstances which need to be discussed with the instructor for approval and as long as the solution is not discussed or made available. The lowest homework assignment grade will not be included in course grade. Use standard size paper and include your name and homework assignment number at the top or on the cover page. Midterm exam will be based on the course materials – i.e., lectures, homework assignments, and readings. See table below for details.

**Project:**
Early in the semester, students will consult with the instructor to determine a project topic that benefits from their overall academic objectives or current professional activities (see table below for due dates). Possible modeling and simulation domains are numerous including enterprise engineering, software engineering, computer and social networks, embedded devices, computer networks, artificial or ecological agents, and system biology. Projects should be carried out as two-member teams. Projects can focus on students’ interest including thesis research topics.

**Final project report grading:**
Introduction and problem description: 10%
Analysis and simulation model formulation: 30%
Simulation models and experiments: 40%
Results and analysis: 15%
Conclusions: 5%

**Grading Policy and Grade Distribution:**
Students are responsible for all the material covered and discussed during lectures as well as any announcements made via email or other means. Examinations may not be taken separately except in special situations with prior arrangement made at least one week in advance. Participation is an essential part of the course and highly encouraged. Grade distributed is

**Academic Integrity and Ethics:**
All instances of alleged cheating will be handled by the Dean’s office according to the Student Code of Conduct and Student Disciplinary Procedures and STA 104-01. This university policy will be applied to all work submitted for grade, including homework assignments, quizzes, exams, reports, presentations, and software development. **Note:** you are encouraged to discuss class assignments and other activities with your instructor and fellow students. However, all work submitted as part of course work must be your own. I.e., final work submitted by student must represent his/her own individual or team efforts unless stated otherwise by the instructor.

**Topics**:

**Part I: Introduction**

1. Course overview
2. Modeling and simulation concepts, application domains, and tools

**Part II: Model development, simulation execution, and experimentation**

3. Fundamental simulation modeling concepts and frameworks
4. System-theoretic model development principles and methods
5. Component-based simulation and modeling tools
6. Simulation protocol concepts, designs, and implementations
7. Simulation experimentation and analysis
8. Network system simulation modeling
9. Multi-resolution, multi-aspect modeling
10. Parallel simulation modeling concepts and methods

**Part III: Heterogeneous modeling and verification & validation**

11. Simulation model verification and validation
12. Model composability and simulation interoperability

* Topics will be covered as time permits
